EXECUTIVE SUMMARY

This study examines the traffic operation and safety at the S.R. 60 (Memorial Highway)/Kennedy Boulevard intersection.

To improve the present operation of the intersection, we recommend the following:

- i) Alter the lane designation in Sherrill Street to an exclusive right lane and a shared left and through lane. This will reduce the number of times the Sherrill Street signal phase operates.
- ii) Modify existing traffic signal timings (currently implemented by the City of Tampa) to reflect the heavy left-turn movement from the north to the east.
- iii) Modify the eastbound approach lane configuration to one left turn lane, two through lanes and a shared through and right lane, and alter the eastbound left turn signal control to protected/permitted operation. These changes will eliminate the existing eastbound left turn trap lane condition on the eastbound approach without detriment to the operation of the intersection.

These improvements are short-term relating to existing traffic volumes. Future traffic growth (including the construction of the Northwest Expressway) will result in the current geometry of this intersection becoming inadequate.

To ensure adequate operation of this intersection for the next ten years and beyond, we recommend that detailed consideration be given to the re-alignment of the intersection so that Memorial Highway (north) and Kennedy Boulevard (east) form the through legs of the intersection. This proposal is shown on the attached Plan.

SECTION I
EXISTING CONDITIONS

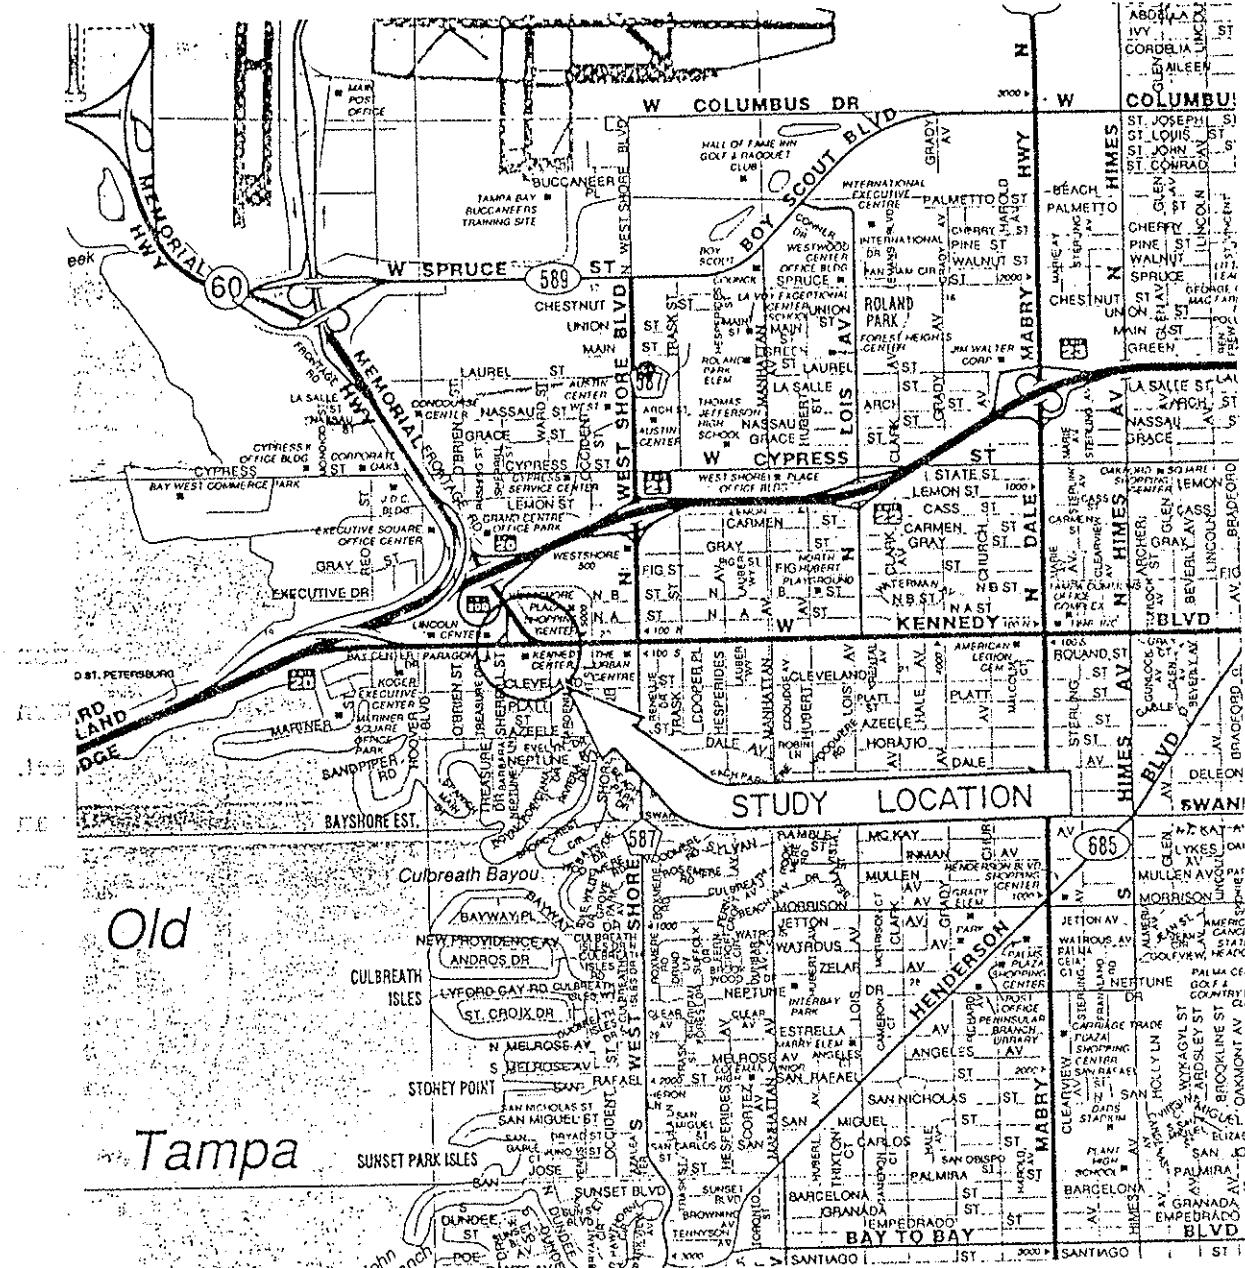

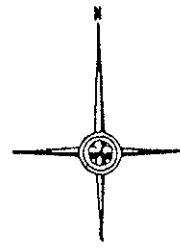

The intersection of S.R. 60 (Memorial Highway) and Kennedy Boulevard is in the City of Tampa. Figure 1 shows the general location of the intersection. Kennedy Boulevard is an east-west arterial through the City of Tampa. S.R. 60 is a major inter-regional route, connecting Pinellas and Hillsborough Counties via the Courtney Campbell Causeway.

INTERSECTION GEOMETRY

The intersection of S.R. 60 (Memorial Highway) and Kennedy Boulevard is presently signalized. The southern leg of the intersection, Sherrill Street, is a local street which also serves as an access point for a parking lot.

The three arterial road approaches to the intersection are divided. At its intersection with S.R. 60, Kennedy Boulevard has two through lanes in each direction, two left-turn lanes eastbound to S.R. 60 and a single westbound left-turn lane into Sherrill Street. The right-turn from Kennedy Boulevard on to Memorial Highway is provided by an exclusive right-turn lane located well in advance (425') of the main intersection. The Memorial Highway approach to the intersection consists of a right-turn lane, a left-turn lane and a shared left and through lane. Photographs of the intersection are included in Figure 2. A Condition Diagram for the intersection is shown in Figure 3.

The intersection is controlled by a traffic signal. The signal heads are suspended from a diagonal span wire supported by concrete strain poles on the northeast and southwest corners of the main intersection. Pedestrian signals operate on the north, west and south legs of the intersection.

TRAFFIC VOLUMES

DSA undertook an eight-hour turning movement count at the intersection in March 1990. The turning movement count included truck volumes and pedestrian and bicycle volumes.

Weather was clear and no accidents nor disturbances were noted which would detract from the validity of the data. The count data is included in Appendix A. Table 1 summarizes the eight-hour turning movement count.

ACCIDENT HISTORY

Detailed accident data for the years 1988 and 1989 was obtained from the City of Tampa.

Accident summary data for the years 1987-1988 was supplied by FDOT. Table 2 summarizes the accident data for the years 1987-1989.

SECTION II

INTERSECTION ASSESSMENT

In considering the traffic operation and safety of this intersection a number of different factors were included in the analysis. This analysis includes both current operation and possible future geometric improvements.

QUALITATIVE ASSESSMENT

The intersection was observed during morning and evening peak periods by a qualified Engineer of DSA.

Based upon these inspections, the following comments are relative to the operation of the intersection:

- i) Pavement on each of the approaches is in good condition.
- ii) All signal displays are well located and operate satisfactorily.
- iii) Advance direction signing is well located and in good condition. However, most of the pavement markings at the intersection are worn and faded and require maintenance.
- iv) The current four-phase traffic signal operation is appropriate for the intersection.
The four phases are:
 1. Eastbound left and through traffic.
 2. Eastbound and westbound through traffic.
 3. Southbound traffic.
 4. Northbound traffic.

The left-turn from Kennedy Boulevard into Memorial Highway (west to north) is controlled by green, yellow and red turn arrows. The left-turn from Kennedy Boulevard into Sherrill Street (east to south) does not have any turn arrows and is a permissive movement during the main street phase.

- vi) S.R. 60 just north of the intersection curves to the west. Traffic queued in S.R. 60, waiting to travel southbound, often extended back some 400' to the curve.
- vii) The green signal display for Sherrill Street (the northbound signal phase) occasionally operated even though there was no traffic waiting to enter the intersection.

Sherrill Street approach lanes are currently designated as an exclusive left-turn lane and a shared through and right lane. The incidence of the northbound phase being needlessly called might be reduced if the lane designation was altered to an exclusive right and a shared left and through. The right turn lane could then operate with a delay detector, thus eliminating right-turn traffic calling the northbound phase unless it has been substantially delayed.

- viii) Kennedy Boulevard traffic cleared every cycle, however, delays were experienced for traffic southbound on Memorial Highway.
- ix) Extra pavement exists on the westbound approach of Kennedy Boulevard such that an additional through lane could be provided. Modification would be required to the S.R. 60 right turn island so that the additional lane could continue through the intersection (see photo 2 of Figure 2). This option is considered further in Section III - Geometric Improvements.

ACCIDENT ANALYSIS

In addition to the Accident Summary Data in Table 2 (Section I, Page I-9) a Collision Diagram has been prepared for the intersection. Figure 4 is the Collision Diagram for the intersection covering the years 1988 and 1989.

Four of the five accidents shown in the Collision Diagram occurred on the eastern approach of Kennedy Boulevard and three of the five were rear-end collisions. Two of the five accidents in the two year period shown in the Collision Diagram involved personal injury. All five of the accidents are of a type commonly found at signalized intersections.

TRAFFIC SIGNAL OPERATION

The current signal operation is four-phase within an interconnected system along Kennedy Boulevard. Cycle length in both the AM peak period and the PM peak period is 136 seconds. The current timings, level of service and average delay per vehicle are shown in Table 3.

TABLE 3 - CURRENT TRAFFIC SIGNAL OPERATION

PERCENT OF CYCLE (1)				AM PEAK	LEVEL OF SERVICE (3)	AVG. DELAY SEC./VEH. (3)	
8.2	32.8	47.8	11.2				
PHASE (2)	1	2	3	4			
	18.1	23.9	47.0	11.0	PM PEAK	F	72.1

NOTE: (1) Data provided by City of Tampa.

(2) For phase descriptions see page II-1.

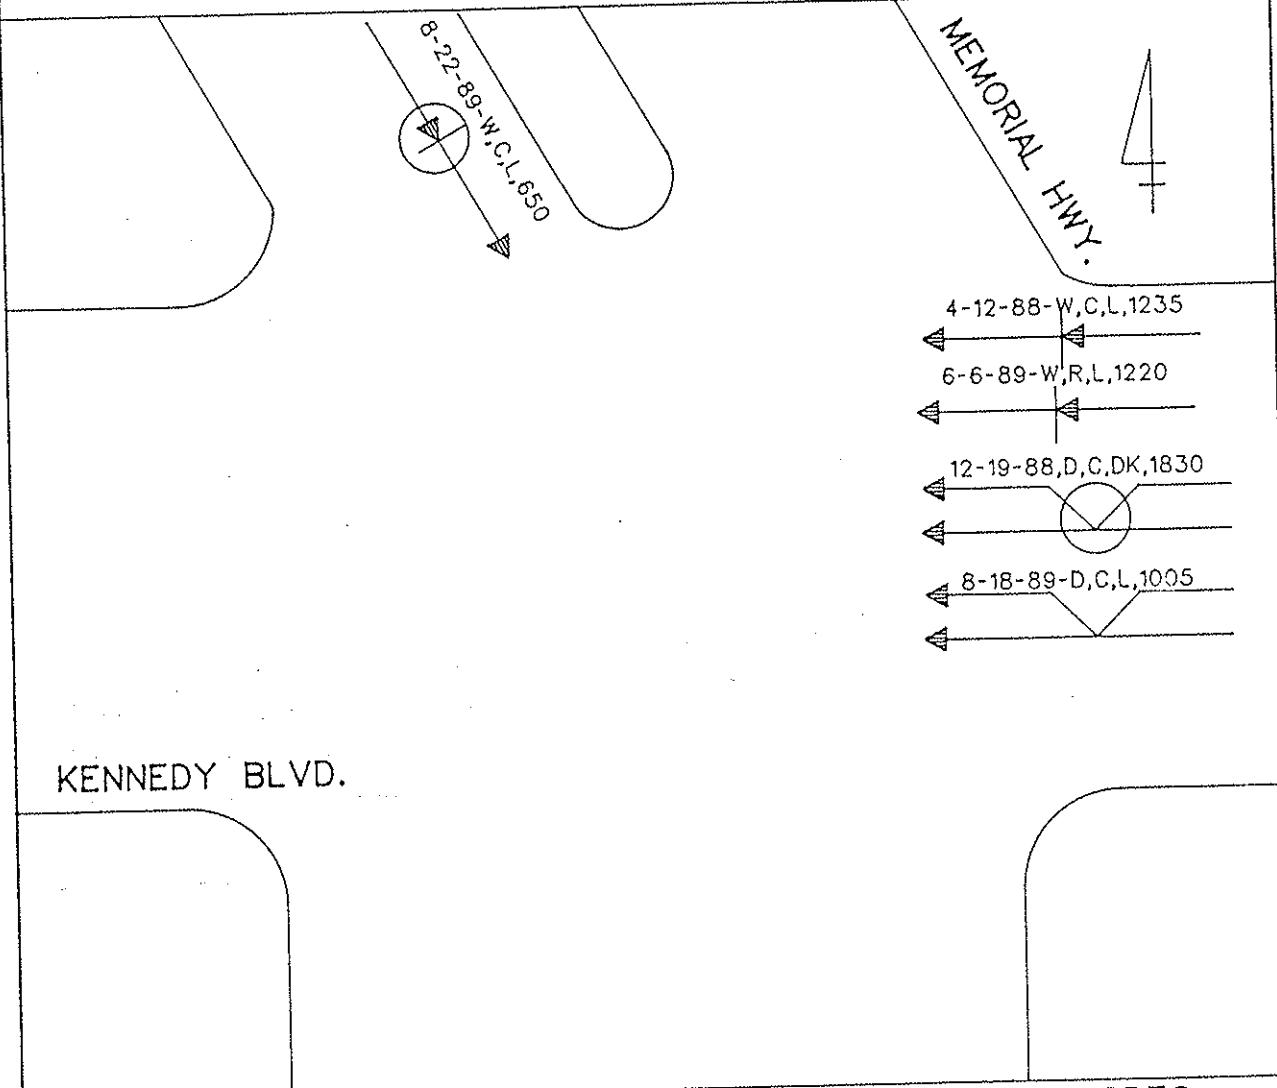

(3) As calculated by Highway Capacity Manual Software (data sheets included in Appendix B).

TOTAL	3	2		5

A number of modifications could be made to the present traffic signal operation and these are discussed below.

- a) Phasing: The only possible changes that could be made to the existing phasing are:
 - i) Control the left turn from Kennedy onto Sherrill Street. This would ordinarily be considered for safety reasons, and would reduce the capacity of the intersection. No safety problem has been identified for the turn and consequently this change is not recommended.
 - ii) Operate the north-south legs as leading concurrent left turns followed by concurrent through movements. This would require an additional lane on the northern approach, and designating one of the southern approach lanes an exclusive left lane. Both alterations could be made within existing right-of-way (although at significant cost on the northern approach) but are not likely to improve capacity nor safety and are therefore not recommended.

Based upon existing traffic volumes and accident history, the present four-phase operation at this location is the most appropriate.

- b) Signal Timing: Modification of the existing PM period signal timings would result in substantial improvement to the operation of the intersection. Using the Highway Capacity Manual, a Level of Service D with an average delay of 36.7 seconds per vehicle was achieved. (The appropriate data sheets are included in Appendix B).

The City of Tampa is presently installing revised signal timings at this intersection, and consequently this matter has not been pursued further here.

- c) Lane Designation: The eastbound approach of Kennedy Boulevard currently has two through lanes and two left turn lanes at the Memorial Highway intersection.

These lanes originate from three approach lanes, resulting in an eastbound through lane on the Kennedy Boulevard approach becoming a left turn trap lane at the Memorial Highway intersection. Although this trap lane condition is well signed on the Kennedy Boulevard approach, the left turn volumes and the intersection's accident history suggest that the trap lane condition could be avoided by converting the eastbound approach to three through lanes and one left turn lane, with the left turn operating protected/permitted rather than the current restricted only. Using the Highway Capacity Manual Software, no change to the intersection's Level of Service nor average vehicle delay was found. (The appropriate data sheets are included in Appendix B).

- c) Signal Linking: This site is part of a signal interconnect system along Kennedy Boulevard.

The Memorial Highway approach to the intersection carries as much traffic as both Kennedy Boulevard approaches combined. Special attention to the signal interconnect plans needs to be made to ensure that Memorial Highway traffic is not being disadvantaged to provide "progression" to Kennedy Boulevard.

SECTION III

GEOMETRIC IMPROVEMENTS

Data supplied by the Florida Department of Transportation shows a projected 10 year traffic growth of 55.6% at this intersection. Table 4 shows the projected turning movement volumes for the year 2000. (The proposed Northwest Expressway will terminate at I-275, just north of this intersection.)

To accommodate this proposed traffic growth, alternative geometric improvements were investigated. Two alternatives were considered within the existing right-of-way. A third alternative considered involves realignment of the intersection by acquiring the Amoco gas station on the northeast corner.

NO RIGHT-OF-WAY ACQUISITION

Within the existing right-of-way at this intersection, two alternative geometric improvements could be implemented:

- i) Provide three through lanes in the westbound direction of Kennedy Boulevard.
- ii) Provide three left-turn lanes from Memorial Highway into Kennedy Boulevard (southbound to eastbound).

Because of the constraints imposed by the existing right-of-way, these two improvements are mutually exclusive.

i) Three Through Lanes Westbound on Kennedy Boulevard

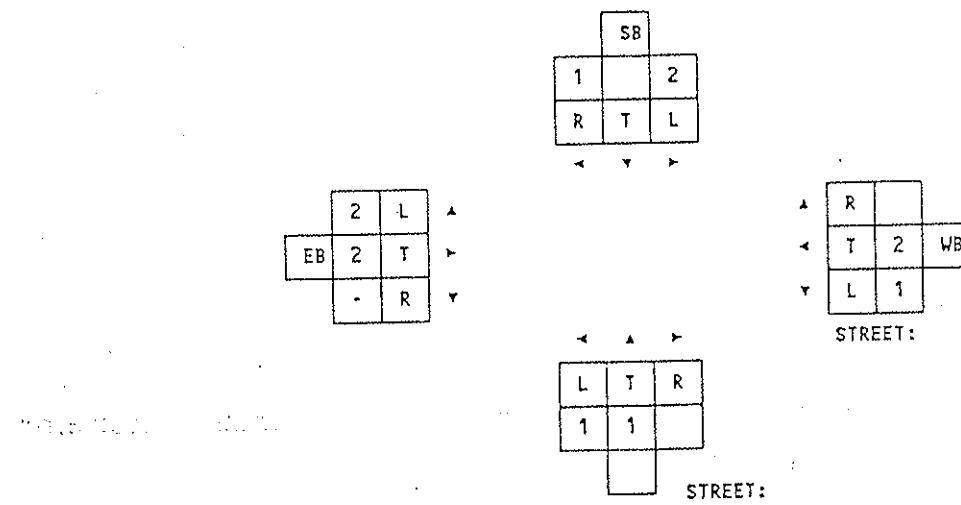

Existing pavement on the westbound approach and westbound departure of Kennedy Boulevard is able to accommodate three through lanes. Lane widths would be 11', which matches the existing widths on the eastbound approach of Kennedy Boulevard.

PERCENT OF APPROACH	48	33		19	1	7			92	82	1		17	93	1	4

Modifications to the existing traffic island on the northwest corner and possibly on the northeast corner would be required.

Figure 5 shows the possible improvement. Photograph 2 of Figure 2 (Page I-3) shows the area of this improvement.

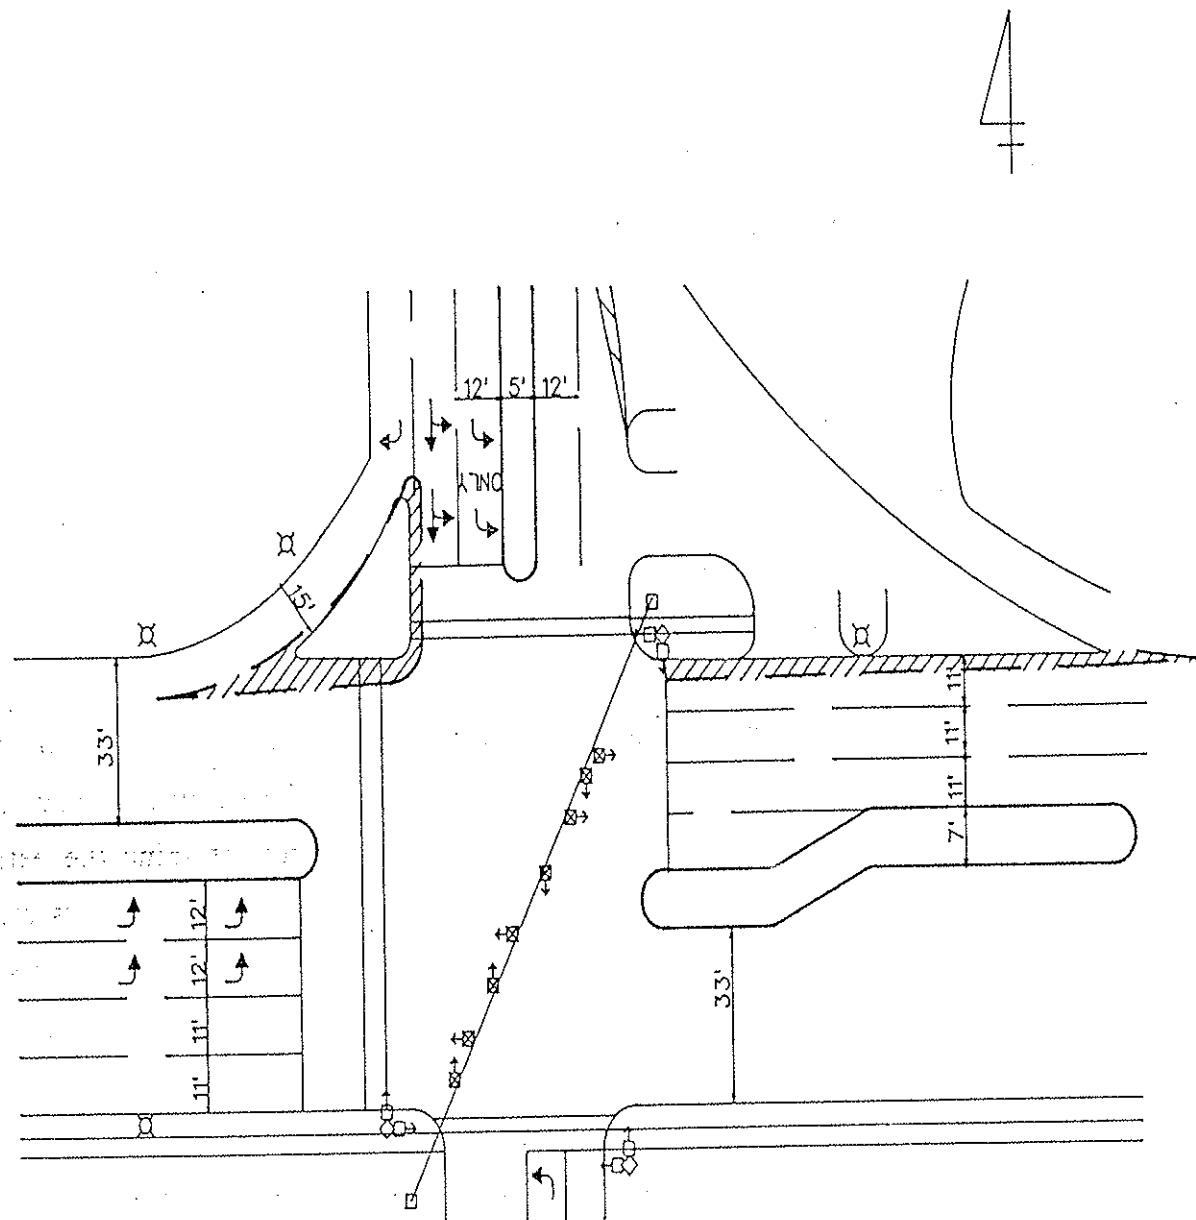

The addition of the third through lane westbound on Kennedy Boulevard would enable modification to signal timings to reduce the time given to Kennedy Boulevard relative to the time given to Memorial Highway.

Other aspects relating to this improvement are:

- * Problems could be experienced with the merge between westbound Kennedy Boulevard traffic and traffic turning right from Memorial Highway into Kennedy Boulevard.
- * Any short-term reductions in delay at the intersection due to the provision of the extra lane would only be achieved by reducing the green time available to Kennedy Boulevard and assigning the extra green time to Memorial Highway. Such timing re-adjustments may have an impact on the signal progression currently operating on Kennedy Boulevard.

THREE THROUGH LANES WESTBOUND

DSA
GROUP
INC.

— — EXISTING CURB TO BE REMOVED

||||| PROPOSED WIDENING

ii) Three Left-Turn Lanes - Memorial Highway to Kennedy Boulevard

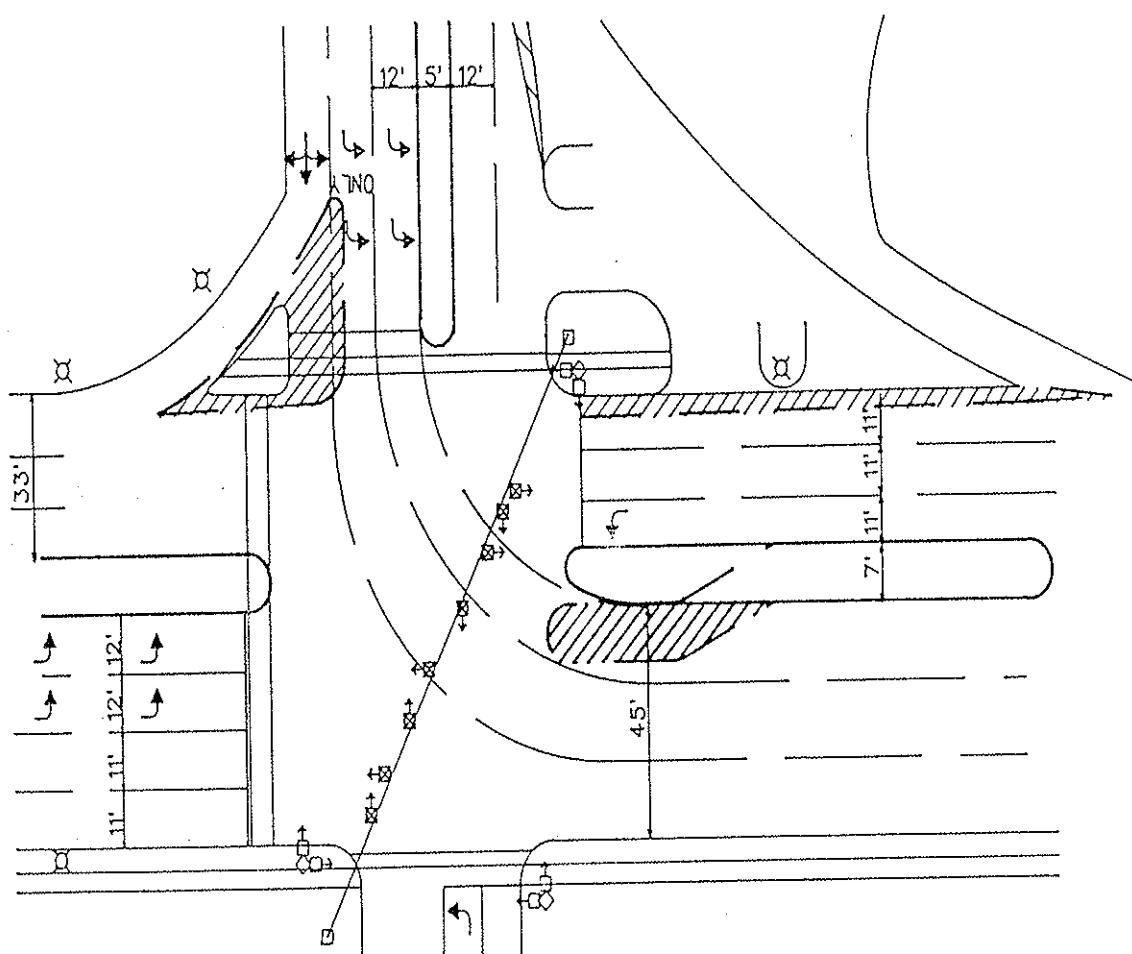

Three left-turn lanes from Memorial Highway into Kennedy Boulevard could be provided by designating the existing right-turn lane as a shared left, through and right lane. This would require modification to the traffic island on the northwest corner of the intersection, and relocation of the median in the eastern leg of Kennedy Boulevard to widen the departure side to accommodate the three left-turn lanes. Figure 6 shows the possible improvement.

Aspects relating to the improvement are:

- * Green time breakdown between Kennedy Boulevard and Memorial Highway would assist signal progression along Kennedy Boulevard.
- * The through movement on Kennedy Boulevard westbound would be offset through the intersection (by one lane width). The impact of this offset is not likely to be significant.
- * The through movement from Memorial Highway to Sherrill Street would require an S-maneuver within the intersection. As this is a low volume maneuver, it is not considered a major problem.
- * The exclusive right-turn lane from Memorial Highway into Kennedy Boulevard would be lost. It could be retained at substantial additional cost, possibly even requiring right-of-way acquisition.
- * Utilization of the third left-turn lane may not be high due to the curve in Memorial Highway some 400' north of the intersection.

////// PROPOSED WIDENING

INTERSECTION REALIGNMENT

The acquisition of the Amoco Gas Station on the Northeast corner of the intersection would enable the complete re-alignment of the intersection so that Memorial Highway (north) and Kennedy Boulevard (east) form the through legs of the intersection.

Figure 7 is a layout of the proposed alignment.

This proposal would result in the existing west-bound right turn movement, which currently operates as an unsignalized movement utilizing the right-turn slip lane in advance of the Amoco service station, operating as a through movement under signalized control.

Approach count data for the intersection has been provided by FDOT, and this data is included in Appendix A. The right turn volumes westbound to northbound have been factored up to reflect the estimated year 2000 traffic volumes for this movement.

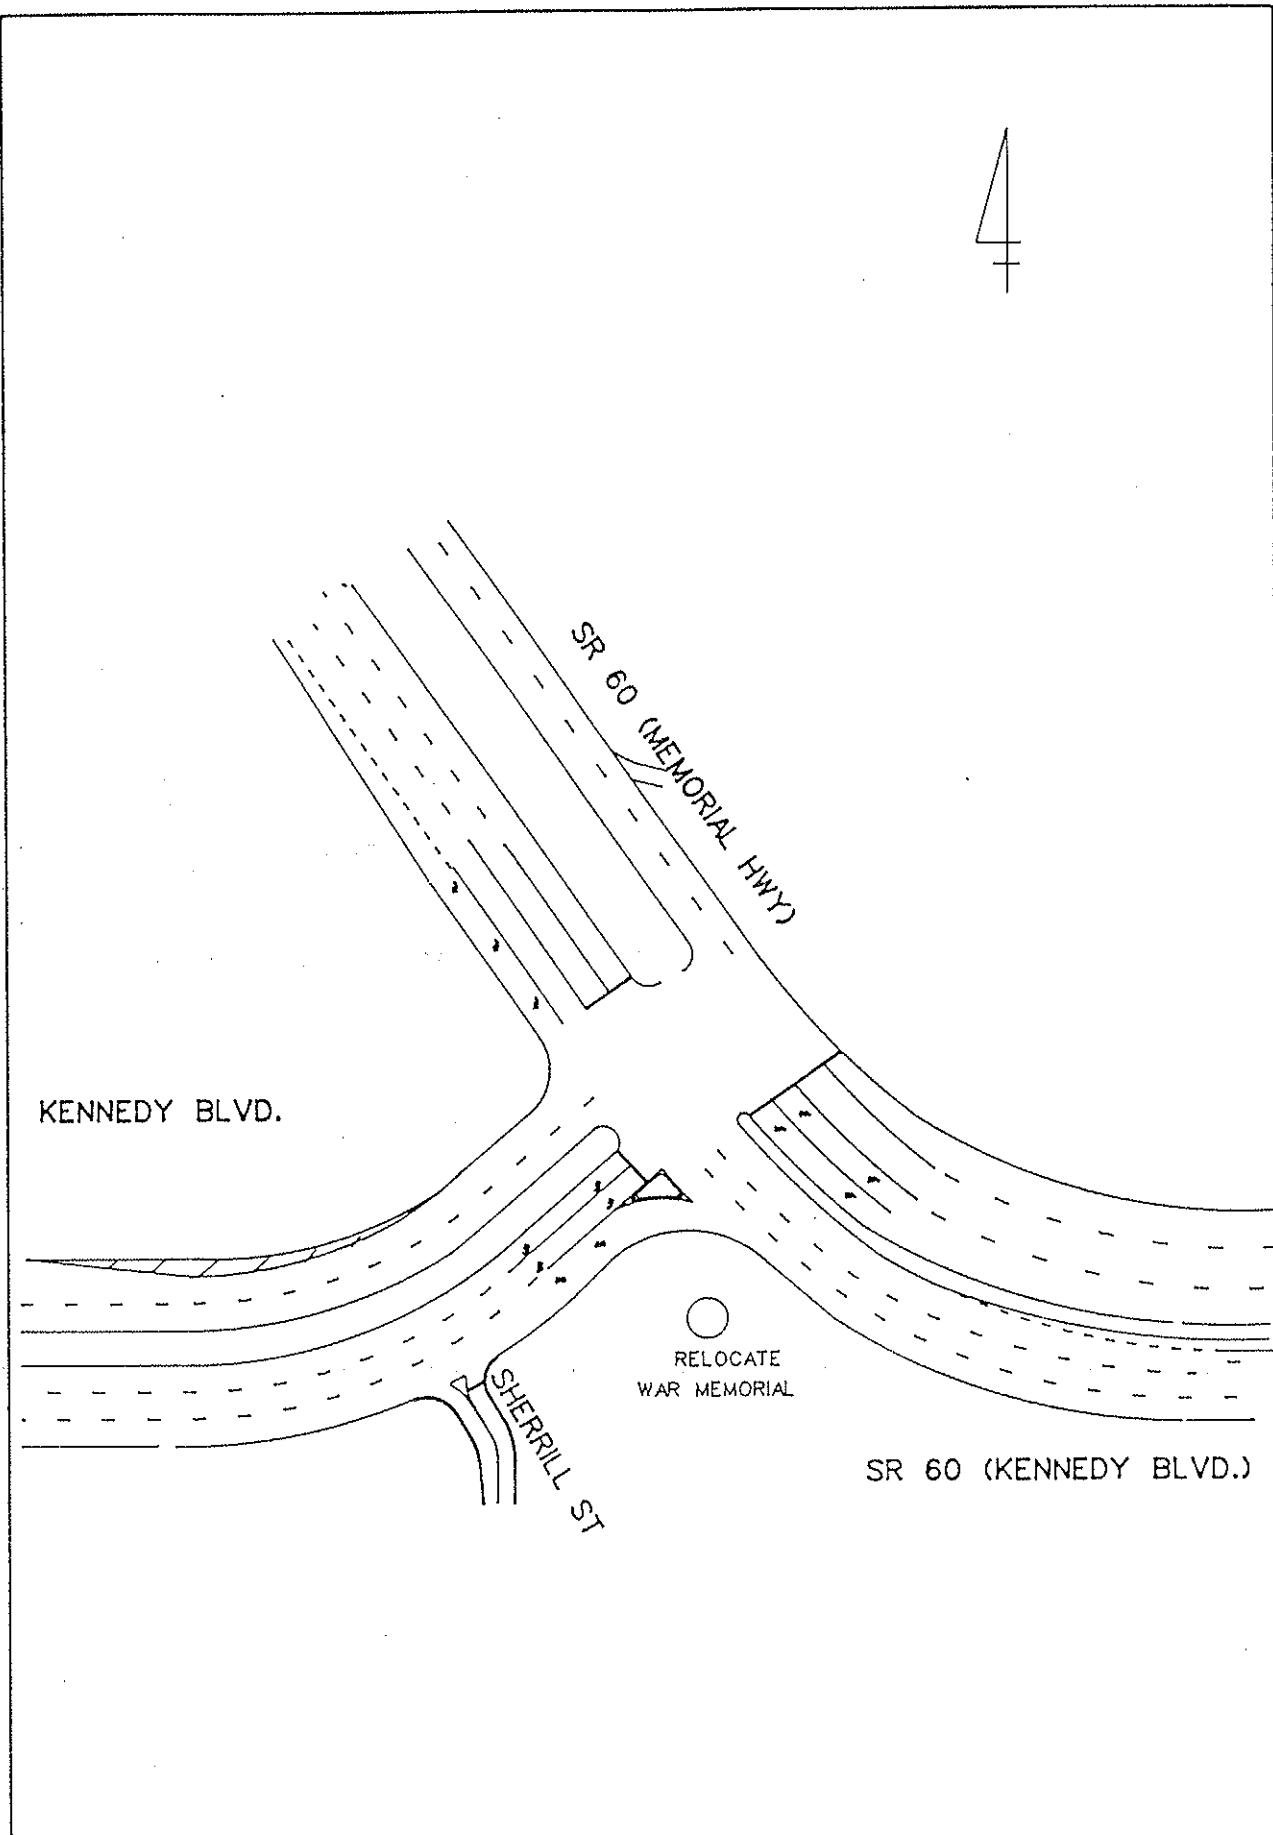

Table 5 shows the adjusted and re-alignment peak hour traffic volumes for the year 2000.

TABLE 5 - YEAR 2000 REALIGNED TRAFFIC VOLUMES

	EASTBOUND			WESTBOUND			NORTHBOUND			SOUTHBOUND		
	L	T	R	L	T	R	L	T	R	L	T	R
AM PEAK	83	---	613	---	---	---	1,340	1,349	---	---	1,869	313
PM PEAK	448	---	1,241	---	---	---	1,053	1,957	---	---	2,203	102

S.R. 60 (MEMORIAL HWY.) AT KENNEDY BLVD.
INTERSECTION RE-ALIGNMENT

DSA
GROUP
INC.

Aspects relating to this proposal are:

- * It reinforces the main traffic flow direction at the intersection.
- * Substantial intersection beautification would be possible. (The existing War Memorial north of the gas station could be relocated.)
- * Design speed through the intersection would be in the order of 30 mph.
- * The layout is consistent with proposed future widening of Memorial Highway to six lane divided under reconstructed I-275.

RECOMMENDATIONS

Table 6 shows the Levels of Service under year 2000 traffic volumes for the existing geometry, three through lanes westbound on Kennedy, three left turn lanes into Kennedy, and the intersection realignment option, as calculated using the Highway Capacity Manual Software.

TABLE 6 - LEVELS OF SERVICE, YEAR 2000

Projected Year 2000 Traffic	Level of Service	
	AM Peak	PM Peak
Existing Geometry	*	*
Three Lanes Westbound	E	*
Three Left Turn Lanes	E	F
Intersection Realignment	C	D

Note * = Delay cannot be calculated: LOS meaningless.

The appropriate Highway Capacity Manual data sheets are included in Appendix B.

This intersection will experience substantial traffic growth over the next 10 years. Without major construction being undertaken at the intersection, traffic delays will be extreme and safety is likely to be significantly reduced.

We recommend that the intersection realignment as proposed in this report be implemented as the most feasible option to ensure that this intersection operates satisfactorily into the future.

To improve the present operation of the intersection, we recommend the following short term improvements:

- i) Alter the lane designation in Sherrill Street to an exclusive right lane and a shared left and through lane. This will reduce the number of times the Sherrill Street signal phase operates.
- ii) Modify existing traffic signal timings (currently implemented by the City of Tampa) to reflect the heavy left-turn movement from the north to the east.
- iii) Modify the eastbound approach lane configuration to one left turn lane, two through lanes and a shared through and right lane, and alter the eastbound left turn signal control to protected/permitted operation.
